

## An opportunity... Not a problem

Monitor Anything You Can Transpond

Control Existing Equipment

Remote Access and Supervision

Advanced Control Logic

Email, SNMP and SMS Text Notification

Flexible Interface With Live Update

Condition Based Monitoring

Logging / Archiving To Excel

Adaptable Sensor Range

Periodic Events, Scheduling and Delays

The adaptable solution...

...to all your requirements

NetCommander's  
Monitoring and Control Solutions  
This *is* the answer to your problems

# NetCommander is your Solution

NetCommander is a highly versatile web accessible network device for monitoring and control of equipment. If you need a system to be monitored and controlled then we provide the intelligence to your system. Using our range of sensors or any device that fits NetCommander's requirements you can react to any situation and interfacing to existing equipment allows you add a layer of intelligent control to your system. Interfacing is made possible through electrical outputs, X10 control and serial commands, as well as providing direct telnet connections to serially connected equipment. Our interfaces are highly flexible to match the needs of any system and may be customised to provide intuitive control at your finger-tips.

NTP server updates and an internal clock allows time and date to be taken into consideration, allowing periodic events, delayed reactions and events that fit the time of day.

Keep track of situations using counters to record how many times an event occurs; for example: the number of people entering and leaving the building. Then you can use the values to trigger events; for example: if somebody hasn't left the building by 8pm then alert security.

Raising the alert can be made appropriate to the situation, from SNMP traps for network issues to security lights and sirens for

intruder security. The right person is contacted immediately via SMS text alerts or email. False alarms can be eliminated by using our event system to react only when the situation demands it.

Reaction to any situation means electrical systems can be controlled directly and even motors and control systems can be powered up or down through our pow-r-switch range.

Should our extensive range of sensors and interfaces fail to match your requirements then our team of developers can be called upon to expand the system to fit your needs. All software and hardware design and production is handled in house allowing you flexibility and control in all aspects of bespoke development.

## Technical Specification

### Features

- Ethernet attached standalone device
- Monitoring with up to 16 sensors
- Simultaneous control of up to 16 devices
- Advanced internal event logic
- Real time data
- Data logging, storage and graphing
- Alerts: On screen, SNMP, email and SMS text
- Built-in Interface: no installation required
- Platform independent (Apple, Windows, Unix)
- Wi-Fi option

### Sensors

Temperature	Water	Motor
Humidity	Cameras	Contact
Light	Motion	Pressure

### NetCommander General

Dimensions	164mm x 104mm x 55mm
Weight	500g approx.

CE approved

CubeRoot Ltd  
18 Melton Street  
Leicester  
LE1 3NB UK
